

## ENZYMES

### REGULATION OF ENZYMES

#### Introduction

#### Mechanism of Regulation

Regulation through Conformational change

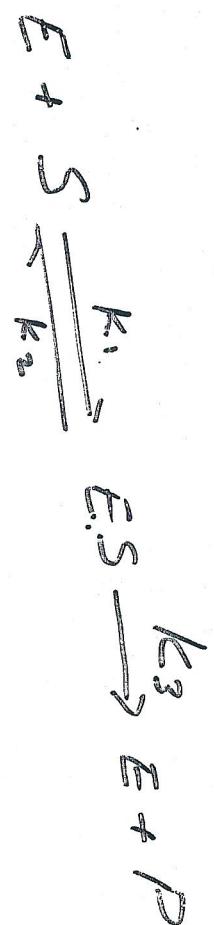

- Substrate conc.
- Reversible Inhibition by products or other compounds
- Allosteric Activation or Inhibition
- Covalent Modification
- Modulator Protein Binding
- Proteolytic cleavage
- Enzyme concentration
- Regulation of Metabolic pathways

Many enzymatic reactions can be described by Michelis-Menten kinetics :-  
 M-M analyzed enzymatic reactions under simplified assumptions :-

- The reaction has only one substrate

$$[S] \gg [E]$$

- Initial rate i.e.  $[P]$  is negligible
- Course of reaction for a short time.

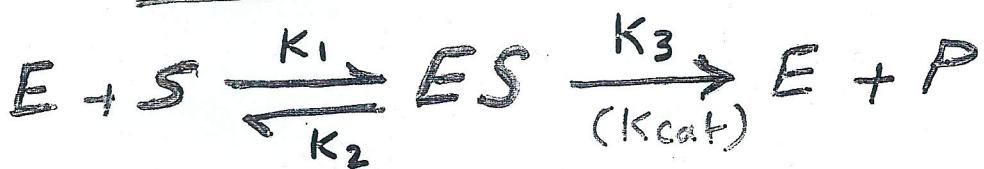

$$v = k_3 [E.S]$$

$$V_{max} = k_3 [E_T]$$

## The Michaelis-Menten Equation 2

The Steady-state Assumption

$$(\text{velocity}) v = K_3 [ES]$$

$$\text{Rate of formation of } ES = k_1 [E][S]$$

$$\text{Rate of Breakdown of } ES = [k_2 + k_3][ES]$$

At steady state  $[ES]$  remains constt.

$$[ES] = \frac{[E][S]}{k_2 + k_3 / k_1} = \frac{[E][S]}{K_m}$$

$$\text{The Michaelis constt. } K_m = \frac{k_2 + k_3}{k_1}$$

$$E = E_T - [ES]$$

on substituting and rearrangement

$$[ES] = [E_T] \frac{[S]}{[S] + K_m}$$

by substituting

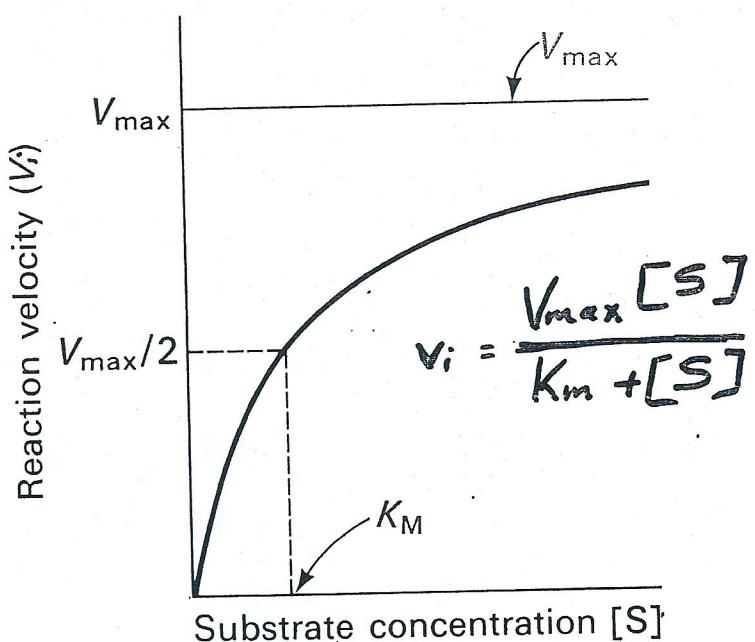

$$v = K_3 [ES]$$

$$v = K_3 [E_T] \frac{[S]}{[S] + K_m}$$

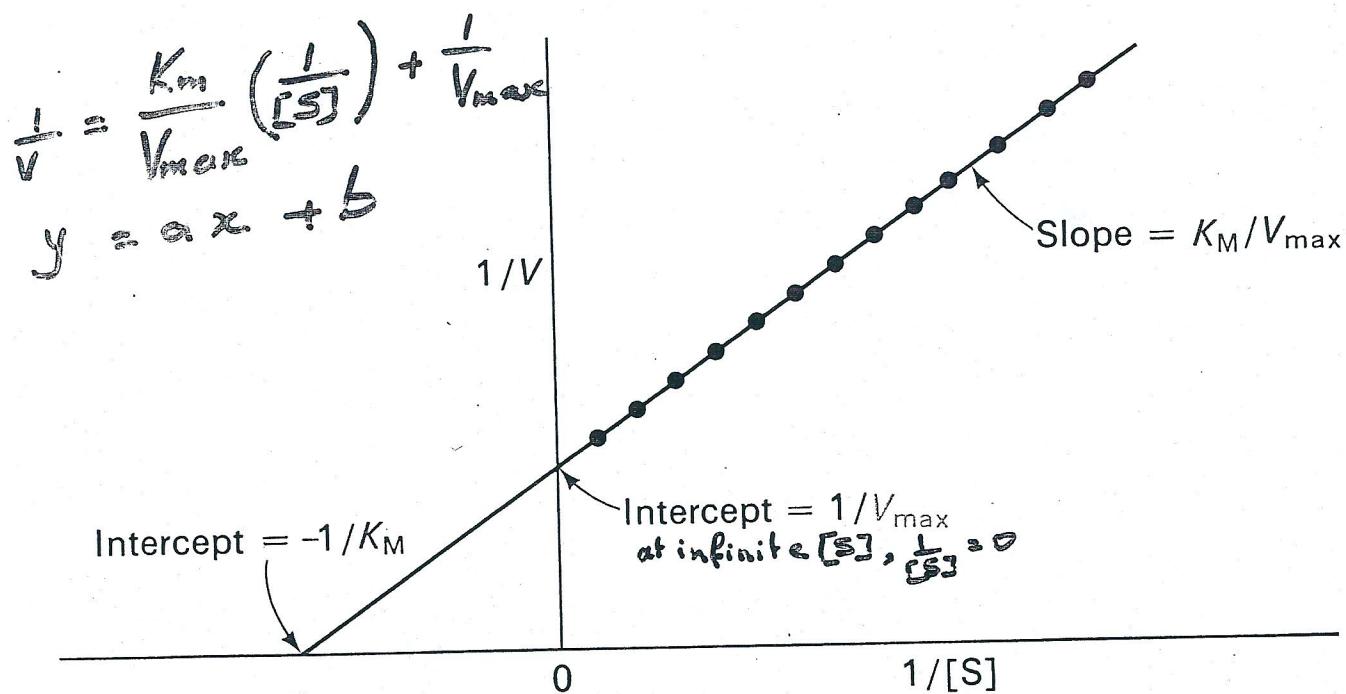

$$V_{\max} = K_3 [E_T]$$

$$v = V_{\max} \frac{[S]}{K_m + [S]}$$

4

i. At very low  $[S]$  i.e.  $K_m \gg [S]$

$$V = [S] \frac{V_{max}}{K_m + [S]} \rightarrow V = [S] \frac{V_{max}}{K_m}$$

ii. At very high  $[S]$  i.e.  $[S] \gg K_m$

$$V = V_{max}$$

3. When  $[S] = K_m$

$$V = V_{max}/2$$

$K_m$  values depends

1. Particular substrate
2. Presence of I or activator
3. pH
4. Temp
5. Ionic strength

- Enzyme Units  
 $1 \text{ unit} = \text{production of } 1 \mu\text{mole product per min}$

- Specific Activity  
 $= \text{Units/mg protein}$

S

When  $K_2 \gg K_3$  in  $E + S \xrightleftharpoons{K_1} ES \xrightarrow{K_3} E + P$

5  
a

$$K_m = \frac{K_2 + K_3}{K_1} \approx \frac{K_2}{K_1} = K_d \quad \text{if } K_3 \text{ is much smaller than } K_2$$

Under this condition

$K_m$  is a measure of the strength of ES complex

High  $K_m$  — weak binding

Low  $K_m$  — strong binding

- $K_m$  indicates the affinity of ES complex  
when  $K_2 \gg K_3$

Turnover number of an enzyme :-  $\frac{K_3}{K_1}$

number of substrate molecules converted into product by an enzyme molecule in a unit time when the enzyme is fully saturated with substrate

$$V_{max} = K_3 [E] \rightarrow K_3 = V_{max} / [E]$$

e.g.  $10^{-6}$  M of C.A catalyzes the formation of  $0.6 \text{ M } H_2CO_3$  per sec. when saturated with S

$$\text{Turnover-number.} = \frac{K_3}{K_1} = \frac{6 \times 10^{-1}}{10^{-6}} = \underline{\underline{6 \times 10^5 \text{ s}^{-1}}}$$

- Each round of catalysis occurs in a time equal to  $\frac{1}{K_3} = \frac{1}{6 \times 10^5} = \underline{\underline{1.7 \mu\text{s}}}$

Examples:

Enz.

Turn over number (per sec)

C. A

600,000

Acetylcholinesterase

25,000

LDH

1,000

DNA polymerase I

15

Lysozyme

0.5

## Significance of $K_m$ and $V_{max}$

$$K_m = \frac{K_2 + K_3}{K_1}$$

$$V = K_3 [E][S] \frac{[S]}{[S] + K_m} \quad V_{max} = K_3 [E][S]$$

$$V = V_{max} \frac{[S]}{K_m + [S]}$$

(1)  $f_{ES}$  = fraction of sites filled at any  $[S]$  can be calculated if  $K_m$  is known

$$f_{ES} = \frac{V}{V_{max}} = \frac{[S]}{[S] + K_m}$$

(2) When  $K_2 \gg K_3$  (a limiting case)

$$K_m = \frac{K_2}{K_1} = K_d$$

$K_m$  indicates affinity of  $E$  to  $S \rightarrow ES$

6

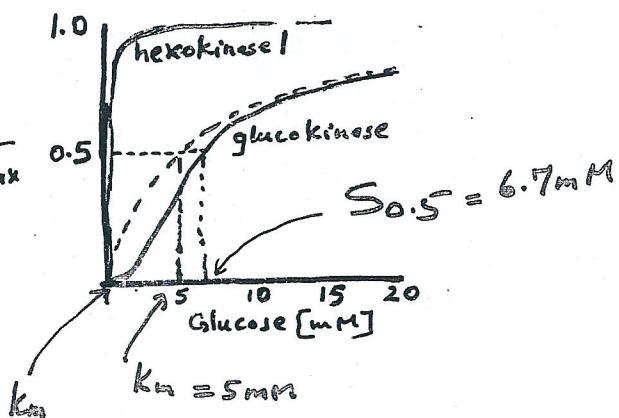

## Hexokinase Isozymes have different $K_m$ values for glucose

HK-I in erythrocytes, muscle, brain & most other tissues  
 $(110 \text{ kD})$   $K_m = 0.02 - 0.13 \text{ mM}$

GK isozyme in liver: 5 to 6 mM ( $K_m$ )  
 $(55 \text{ kD})$

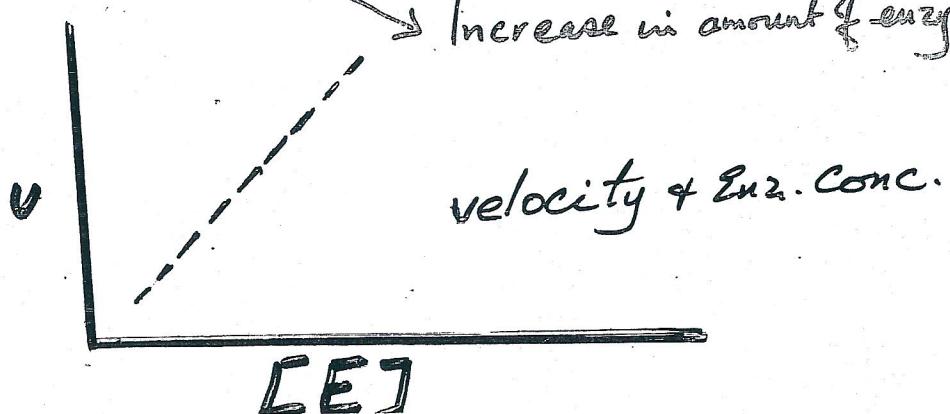

$K_m$  for GK was calculated from Michaelis-Menten Eq.

$$\frac{V_i}{V_{max}}$$

- Which enzyme activity increases after a high carbohydrate meal

- $V_{max} = k_3 [E_T]$ 
  - Increase in  $V_{max}$  → Increase in Catalytic power,  $k_{cat}$  and/or Increase in amount of enzyme
